Roadmap: measured so far, planned next

Goal: about 1B parameters, text not worse than a matched autoregressive baseline.

COMPLETED

TinyWorld

Synthetic grammar
Codec, generator, AR
Latency and quality

Sudoku

E6 to E20, two seeds
Easy 98.1%, medium 83.4%
Hard boards still behind

Checkpoint port

Runs Kumbong et al.
TinyStories, Sudoku, XSum
Agrees with PyTorch, tested

TinyStories

E21 to E32, size and data
NCM/AR ratio 3.3 to 2.1
Still above 2 (single seeds)

PLANNED, IN ORDER

01 Understand the remaining gap

Released recipe details, Muon, neighbour corruption, codec seeds

02 Prompt-conditioned training

Prefix training of our own models; released XSum generator ported

03 Mixed-precision throughput

bf16 done for the 12M recipe; larger sizes untested

04 Natural-text corpus

Several billion tokens

05 100M model, about 2B tokens

The go / no-go against AR

06 300M, then about 1B

Only if NCM is close to AR at matched compute

Planned steps are plans, not results.

No delivery dates.
